# Migrate from CN1610 switches to BES-53248 switches

# Migrate CN1610 cluster switches to Broadcom-supported BES-53248 cluster switches

You must be aware of certain configuration information, port connections, and cabling requirements when you migrate CN1610 cluster switches to Broadcom-supported BES-53248 cluster switches.

- The following cluster switches are supported:
  - · CN1610
  - · BES-53248
- The cluster switches support the following node connections:
  - NetApp CN1610: ports 0/1 through 0/12 (10 GbE)
  - BES-53248: ports 0/1-0/16 (10/25 GbE)

Additional ports can be activated by purchasing port licenses.

- The cluster switches use the following inter-switch link (ISL) ports:
  - NetApp CN1610: ports 0/13 through 0/16 (10 GbE)
  - BES-53248: ports 0/55-0/56 (100 GbE)
- The Hardware Universe contains information about ONTAP compatibility, supported EFOS firmware, and cabling to BES-53248 cluster switches.
- · The appropriate ISL cabling is as follows:
  - Beginning: For CN1610 to CN1610 (SFP+ to SFP+), four SFP+ optical fiber or copper direct-attach cables.
  - Interim: For CN1610 to BES-53248 (SFP+ to SFP28), four 10G SFP+ optical transceiver/fiber or copper direct-attach cables.
  - **Final:** For BES-53248 to BES-53248 (QSFP28 to QSFP28), two QSFP28 optical transceivers/fiber or copper direct-attach cables.

After your migration completes, you might need to install the required configuration file to support the Cluster Switch Health Monitor (CSHM) for BES-53248 cluster switches.

See Installing the Cluster Switch Health Monitor (CSHM) configuration file in the Switch Setup and Configuration Guide for Broadcom-supported BES-53248 switches guide.

See Configuring the cluster switch log collection feature in the Switch Setup and Configuration Guide for Broadcom-supported BES-53248 switches for the steps required to enable cluster health switch log collection used for collecting switch-related log files.

# How to migrate CN1610 cluster switches to BES-53248 cluster switches - BES-53248 switches

To replace the existing CN1610 cluster switches in a cluster with Broadcom-supported BES-53248 cluster switches, you must perform a specific sequence of tasks.

#### What you'll need

The examples in this procedure use two nodes, each deploying two 10 GbE cluster interconnect ports: e0a and e0b.

The examples in this procedure use the following switch and node nomenclature:

- The command outputs might vary depending on different releases of ONTAP software.
- The CN1610 switches to be replaced are CL1 and CL2.
- The BES-53248 switches to replace the CN1610 switches are cs1 and cs2.
- The nodes are node1 and node2.
- The switch CL2 is replaced by cs2 first, followed with CL1 by cs1.
- The BES-53248 switches are pre-loaded with the supported versions of Reference Configuration File (RCF) and Ethernet Fabric OS (EFOS) with ISL cables connected on ports 55 and 56.
- The cluster LIF names are node1\_clus1 and node1\_clus2 for node1, and node2\_clus1 and node2\_clus1 and node2\_clus2 for node2.

#### About this task

This procedure covers the following scenario:

- The cluster starts with two nodes connected to two CN1610 cluster switches.
- CN1610 switch CL2 is replaced by BES-53248 switch cs2:
  - Disconnect the cables from all cluster ports on all nodes connected to CL2, and then use supported cables to reconnect the ports to the new cluster switch cs2.
  - Disconnect the cables between ISL ports CL1 and CL2, and then use supported cables to reconnect the ports from CL1 to cs2.
- CN1610 switch CL1 is replaced by BES-53248 switch cs1:
  - Disconnect the cables from all cluster ports on all nodes connected to CL1, and then use supported cables to reconnect the ports to the new cluster switch cs1.
  - Disconnect the cables between ISL ports CL1 and cs2, and then use supported cables to reconnect the ports from cs1 to cs2.

#### Steps

1. If AutoSupport is enabled on this cluster, suppress automatic case creation by invoking an AutoSupport message:

```
system node autosupport invoke -node * -type all -message MAINT=xh
```

where x is the duration of the maintenance window in hours.

The AutoSupport message notifies technical support of this maintenance task so that automatic case creation is suppressed during the maintenance window.

The following command suppresses automatic case creation for two hours:

```
cluster1::*> system node autosupport invoke -node \* -type all -message
MAINT=2h
```

2. Change the privilege level to advanced, entering y when prompted to continue:

```
set -privilege advanced
```

The advanced prompt (\*>) appears.

3. Verify that auto-revert is enabled on all cluster LIFs:

network interface show -vserver Cluster -fields auto-revert

4. Display information about the devices in your configuration:

```
network device-discovery show -protocol cdp
```

The following example displays how many cluster interconnect interfaces have been configured in each node for each cluster interconnect switch:

vode/	Local	Discovered		
Protocol	Port	Device (LLDP: ChassisID)	Interface	Platform
node2	/cdp			
	e0a	CL2	0/2	CN1610
	e0b	CL1	0/2	CN1610
node1	/cdp			
	e0a	CL2	0/1	CN1610
	e0b	CL1	0/1	CN1610

- 5. Determine the administrative or operational status for each cluster interface.
  - a. Display the cluster network port attributes:

network port show -ipspace Cluster

cluster1:	:*> network p	ort show -i	pspace	Clust	cer		
Node: nod	e1						
Ignore						G (Mil)	II 1 + 1-
Health						Speed (Mbps)	неатти
	IPspace	Broadcast :	Domain	Link	MTU	Admin/Oper	Status
Status							
 e0a	 Cluster	Cluster		110	9000	auto/1000	healthy
false	Clubccl	CIUDCCI		αр	3000	aaco, 10000	neareny
e0b	Cluster	Cluster		up	9000	auto/10000	healthy
false							
Node: nod	e2						
Ignore							
Health						Speed (Mbps)	Health
	IPspace	Broadcast :	Domain	Link	MTU	Admin/Oper	Status
Status	-						
	 Cluster	Clustor		1170	9000	211+0/10000	hool+h;;
false	Clustel	CIUSCEI		uр	9000	aut0/10000	Hearthy
	Cluster	Cluster		up	9000	auto/10000	healthy
false							
1 ontrice	woro display	ad					
4 entries	were display	eu.					

### b. Display information about the logical interfaces:

network interface show -vserver Cluster

```
cluster1::*> network interface show -vserver Cluster
         Logical Status Network
                                          Current
Current Is
Vserver Interface Admin/Oper Address/Mask
                                          Node
Port Home
______ _____
Cluster
         node1 clus1 up/up 169.254.209.69/16 node1
e0a true
         node1 clus2 up/up 169.254.49.125/16 node1
e0b
      true
         node2 clus1 up/up 169.254.47.194/16 node2
e0a
      true
         node2 clus2 up/up 169.254.19.183/16 node2
e0b
      true
4 entries were displayed.
```

- 6. Verify that the appropriate port licenses, RCF, and EFOS image are installed on the new BES-53248 switches as necessary for your requirements, and make any essential site customizations, such as users and passwords, network addresses, and so on.
- 7. Ping the remote cluster interfaces:

```
cluster ping-cluster -node node-name
```

The following example shows how to ping the remote cluster interfaces:

```
cluster1::*> cluster ping-cluster -node node2
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1
                                              e0a
Cluster node1 clus2 169.254.49.125 node1
                                              e0b
Cluster node2 clus1 169.254.47.194 node2
                                              e0a
Cluster node2 clus2 169.254.19.183 node2
                                              e0b
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
Detected 9000 byte MTU on 4 path(s):
    Local 169.254.47.194 to Remote 169.254.209.69
    Local 169.254.47.194 to Remote 169.254.49.125
    Local 169.254.19.183 to Remote 169.254.209.69
    Local 169.254.19.183 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

8. Shut down the ISL ports 13 through 16 on the active CN1610 switch CL1:

shutdown

The following example shows how to shut down ISL ports 13 through 16 on the CN1610 switch CL1:

```
(CL1) # configure
(CL1) (Config) # interface 0/13-0/16
(CL1) (Interface 0/13-0/16) # shutdown
(CL1) (Interface 0/13-0/16) # exit
(CL1) (Config) # exit
(CL1) #
```

9. Build a temporary ISL between CN1610 CL1 and new BES-53248 cs2. The ISL will only be defined on cs2 as the existing ISL on CL1 can be reused.

The following example builds a temporary ISL on cs2 (ports 13-16) to be connected to the existing ISL on CL1 (ports 13-16):

```
(cs2) # configure
(cs2) (Config) # port-channel name 1/2 temp-isl-cn1610
(cs2) (Config) # interface 0/13-0/16
(cs2) (Interface 0/13-0/16) # no spanning-tree edgeport
(cs2) (Interface 0/13-0/16) # addport 1/2
(cs2) (Interface 0/13-0/16) # exit
(cs2) (Config) # interface lag 2
(cs2) (Interface lag 2) # mtu 9216
(cs2) (Interface lag 2) # port-channel load-balance 7
(cs2) (Config) # exit
(cs2) # show port-channel 1/2
Channel Name..... temp-isl-cn1610
Link State..... Down
Admin Mode..... Enabled
Type..... Static
Port-channel Min-links..... 1
Load Balance Option..... 7
(Enhanced hashing mode)
Mbr
      Device/
                Port
                       Port
Ports
      Timeout
                 Speed
                       Active
0/13
    actor/long
                 10G Full False
     partner/long
    actor/long
0/14
                 10G Full False
      partner/long
0/15
    actor/long
                 10G Full False
      partner/long
0/16
     actor/long
                 10G Full False
      partner/long
```

10. On all nodes, remove the cables that are attached to the CN1610 switch CL2.

You must then reconnect the disconnected ports on all nodes to the new BES-53248 switch cs2. Refer to the *Hardware Universe* for approved cabling options.

11. Remove four ISL cables from ports 13 to 16 on the CN1610 switch CL2.

You must attach appropriate approved cabling connecting port 0/13 to 0/16 on the new BES-53248 switch cs2, to ports 13 to 16 on the existing CN1610 switch CL1.

12. Bring up ISLs 13 through 16 on the active CN1610 switch CL1.

The following example illustrates the process of bringing up ISL ports 13 through 16 on CL1:

```
(CL1) # configure
(CL1) (Config) # interface 0/13-0/16
(CL1) (Interface 0/13-0/16,3/1) # no shutdown
(CL1) (Interface 0/13-0/16,3/1) # exit
(CL1) (Config) # exit
(CL1) #
```

#### 13. Verify that the ISLs are **up** on the CN1610 switch CL1:

show port-channel

The Link State should be Up, Type should be Static, and Port Active should be True for ports 0/13 to 0/16:

```
(CL2) # show port-channel 3/1
Channel Name..... ISL-LAG
Link State..... Up
Admin Mode..... Enabled
Type..... Static
Load Balance Option..... 7
(Enhanced hashing mode)
     Device/
Mbr
               Port
                      Port
Ports
     Timeout
               Speed
                      Active
0/13 actor/long 10 Gb Full True
    partner/long
0/14
    actor/long 10 Gb Full True
     partner/long
0/15
     actor/long 10 Gb Full True
     partner/long
     actor/long
0/16
              10 Gb Full True
     partner/long
```

#### 14. Verify that the ISL ports are up on the BES-53248 switch:

show port-channel

```
(cs2) \# show port-channel 1/2
Channel Name..... temp-isl-cn1610
Link State..... Up
Admin Mode..... Enabled
Type..... Static
Port-channel Min-links...... 1
Load Balance Option..... 7
(Src/Dest MAC, VLAN, EType, incoming port)
     Device/
Mbr
              Port
                     Port
Ports
     Timeout
              Speed
                     Active
0/13 actor/long
              10G Full True
     partner/long
    actor/long
0/14
              10G Full True
     partner/long
0/15
    actor/long
              10G Full True
     partner/long
     actor/long
0/16
              10G Full
                     True
     partner/long
```

#### 15. Verify that all of the cluster interconnect ports are reverted to their home ports:

network interface show -vserver Cluster

0_0000			-vserver Cluster	C	
~	Logical	Status	Network	Current	
Current Is			,		
Vserver	Interface	Admin/Oper	Address/Mask	Node	
Port Home	9				
	-				
Cluster					
	node1 clus1	up/up	169.254.209.69/16	node1	e0a
true	_				
	node1 clus2	up/up	169.254.49.125/16	node1	e0b
true					
0140	node2 clus1	up/up	169.254.47.194/16	node?	e0a
true	nodez_crusi	up/up	107.234.47.134/10	110462	Coa
crue		/	1.00 0.00 1.00 /1.00	1 - 0	- 01-
	node2_clus2	up/up	169.254.19.183/16	noαez	e0b
true					

### 16. Verify that all of the cluster ports are connected:

network port show -ipspace Cluster

The following example shows the result of the previous command, verifying that all of the cluster interconnects are up:

<pre>cluster1::*&gt; network port show -ipspace Cluster</pre>							
Node: node1							
Ignore						0 1/261	** 7.1
Health						Speed (Mbps)	Health
	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
e0a false	Cluster	Cluster		up	9000	auto/10000	healthy
e0b false	Cluster	Cluster		up	9000	auto/10000	healthy
Node: node2							
Ignore							
3						Speed(Mbps)	Health
Health							
	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
Status							
e0a	Cluster	Cluster		up	9000	auto/10000	healthy
false		01			0000	/10000	h 1 + h
eUb false	Cluster	Cluster		up	9000	auto/10000	nealtny
4 entries	were display	ed.					

### 17. Ping the remote cluster interfaces:

cluster ping-cluster -node node-name

The following example shows how to ping the remote cluster interfaces:

```
cluster1::*> cluster ping-cluster -node node2
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1
Cluster node1 clus2 169.254.49.125 node1
                                                e0b
Cluster node2 clus1 169.254.47.194 node2
                                               e0a
Cluster node2 clus2 169.254.19.183 node2
                                                eob
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
. . . .
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
. . . . . . . . . . . . . . . . . . .
Detected 9000 byte MTU on 4 path(s):
    Local 169.254.47.194 to Remote 169.254.209.69
    Local 169.254.47.194 to Remote 169.254.49.125
    Local 169.254.19.183 to Remote 169.254.209.69
    Local 169.254.19.183 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

18. On all nodes, remove the cables that are attached to the CN1610 switch CL1.

You must then reconnect the disconnected ports on all nodes to the new BES-53248 switch cs1. Refer to the *Hardware Universe* for approved cabling options.

- 19. Remove four ISL cables from ports 13 to 16 on BES-53248 switch cs2.
- 20. Remove the temporary port-channel 2 on cs2.

The following example removes port-channel 2 and copies the running-configuration file to the startup-configuration file:

```
(cs2) # configure
(cs2) (Config)# deleteport 1/2 all
(cs2) (Config)# exit
(cs2) # write memory

This operation may take a few minutes.
Management interfaces will not be available during this time.

Are you sure you want to save? (y/n) y

Config file 'startup-config' created successfully .
```

#### 21. Verify the status of the cluster node port:

```
network port show -ipspace Cluster
```

The following example verifies that all of the cluster interconnect ports on node1 and node2 are up:

<pre>cluster1::*&gt; network port show -ipspace Cluster</pre>							
Node: node1							
Ignore						Speed(Mbps)	Health
Health						speed (Mpps)	nearch
	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
e0a false	Cluster	Cluster		up	9000	auto/10000	healthy
e0b false	Cluster	Cluster		up	9000	auto/10000	healthy
Node: node2							
Ignore						Speed(Mbps)	Health
Health Port Status	IPspace	Broadcast	Domain	Link	MTU	Admin/Oper	Status
e0a false	Cluster	Cluster		up	9000	auto/10000	healthy
	Cluster	Cluster		up	9000	auto/10000	healthy
4 entries	were display	ed.					

### 22. Verify that the interface is now home:

network interface show -vserver Cluster

The following example shows the status of cluster interconnect interfaces are up and Is home for node1 and node2:

	Logical	Status	Network	Current	Current
Is					
Vserver	Interface	Admin/Oper	Address/Mask	Node	Port
Home					
Cluster		,	1.00 0.51 0.00 0.0 /1.0		
<b></b>	nodel_clusl	up/up	169.254.209.69/16	nodel	e0a
true	node1 clus2	11n/11n	169.254.49.125/16	node1	e0b
true	nodel_clusz	ир/ ир	107.234.47.123/10	nodei	COD
0200	node2 clus1	up/up	169.254.47.194/16	node2	e0a
true	_	1			
	node2_clus2	up/up	169.254.19.183/16	node2	e0b
true					

23. Ping the remote cluster interfaces and then perform a remote procedure call server check:

cluster ping-cluster -node node-name

The following example shows how to ping the remote cluster interfaces:

```
cluster1::*> cluster ping-cluster -node node2
Host is node2
Getting addresses from network interface table...
Cluster node1 clus1 169.254.209.69 node1
Cluster node1 clus2 169.254.49.125 node1
                                               e0b
Cluster node2 clus1 169.254.47.194 node2
                                               e0a
Cluster node2 clus2 169.254.19.183 node2
                                               e0b
Local = 169.254.47.194 169.254.19.183
Remote = 169.254.209.69 169.254.49.125
Cluster Vserver Id = 4294967293
Ping status:
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
. . . . . . . . . . . . . . . . . . .
Detected 9000 byte MTU on 4 path(s):
    Local 169.254.47.194 to Remote 169.254.209.69
    Local 169.254.47.194 to Remote 169.254.49.125
    Local 169.254.19.183 to Remote 169.254.209.69
    Local 169.254.19.183 to Remote 169.254.49.125
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

#### 24. Display the information about the devices in your configuration:

```
network device-discovery show -protocol cdp
```

The following examples show node1 and node2 have been migrated from CN1610 CL2 and CL1 to BES-53248 cs2 and cs1:

Node/	Local	Discovered		
Protocol	Port	Device (LLDP: ChassisID)	Interface	Platform
node1	/cdp			
	e0a	cs2	0/1	BES-53248
	e0b	cs1	0/1	BES-53248
node2	/cdp			
	e0a	cs2	0/2	BES-53248
	e0b	cs1	0/2	BES-53248

25. Remove the replaced CN1610 switches if they are not automatically removed:

```
system cluster-switch delete -device device-name
```

The following example shows how to remove the CN1610 switches:

```
cluster::*> system cluster-switch delete -device CL2
cluster::*> system cluster-switch delete -device CL1
```

26. If you suppressed automatic case creation, re-enable it by invoking an AutoSupport message:

```
system node autosupport invoke -node * -type all -message MAINT=END
```

```
cluster::*> system node autosupport invoke -node \* -type all -message
MAINT=END
```

#### After you finish

See Configuring the cluster switch log collection feature in the Switch Setup and Configuration Guide for Broadcom-supported BES-53248 switches for the steps required to enable cluster health switch log collection used for collecting switch-related log files.
